CHAPTER ONE

INTRODUCTION TO MANAGERIAL ECONOMICS

Dr. Mohammed Alwosabi
Managerial economics is one of the most important and useful courses.

From its name, managerial economics is a combination of two words: economics and management.
• **Economics**

is the study of how best people, governments, firms, and societies make their choices to allocate their scarce resources among competing uses of production, distribution, and consumption of goods and services.
Management is the discipline of organizing and allocating firm's scarce resources to achieve its desired objectives. It involves the ability to organize and administer various tasks in pursuit of certain objectives.
• We can combine these two terms and define managerial economics

• **Managerial economics (ME)**

  is the study of how managers can apply economic principles and analyses as well as quantitative tools and methods in making an effective (optimal) business and managerial decisions involving the best use (allocation) of the organizations' scarce resources to achieve their objectives.
Why Managerial Economics?

1. To provide students with a basic understanding of the economic theory and analytical tools that can be applied in real life decision making problems facing the managers of private, public, and not-for-profit organizations.

2. To show students how to combine the scarce economic resources of a business so that these resources are allocated in the most efficient manner that maximizes the value of their enterprise.
Important Questions in Managerial Decision Making Process

• In making key business decisions, managers must answer the following questions:

First: What are the microeconomic conditions in a particular market?

These questions might include:

1. Market Structure (number of firms competing with one another),
2. Market Supply and Demand Conditions (elastic or inelastic, how to increase demand),
3. How consumer behavior affects revenues
4. How the available technology affects production,
5. How input prices affect costs,
6. Government Regulations,
7. International Dimensions,
8. Future Conditions,
9. Whether entry into the market is easy or difficult,
10. Amount of information available to market participants
Second: What are the macroeconomic factors?

1. Gross Domestic Product (GDP)
2. Factors affecting macro spending behavior
3. Changes in consumption and investment behavior of private individuals
4. New directions of a country’s monetary and/or fiscal policies
5. Developments occurring internationally that affect domestic economy
• Changes in the macro environment affect individual firms and industries through the microeconomic factors of demand, production, cost, and profitability.
3. Should our firm be in this business?

• The answer to this question is based on the previous two questions

4. If so, what price and output levels achieve our goals (of maximizing profits or minimizing costs?)

• This requires a careful analysis of the current market structure and demand components and sensitivity as well as the firm’s production capacity
5. How can we maintain a competitive advantage over our competitors? (by organizing and investing in the organization's resources)

a. **Cost-leader?** A business strategy where a firm becomes the low cost producer in the industry

b. **Product Differentiation?** Whether products sold are differentiated or undifferentiated
c. **Market Niche?** A targetable subgroup within a market segment distinguishable from the rest of the market by certain characteristics

d. **Outsourcing, alliances, mergers, acquisitions**

e. **International Dimensions?** Suppliers, Customers, Competitors
6. What are the risks involved?

- **Risk**
  
  can be defined as the chance or possibility that outcomes of an action will turn out to be worse than expected

- Risk and uncertainty are often used interchangeably.
• **Difference between Risk and Uncertainty**
  Where future events can be defined and probabilities assigned, we have a case of risk.

• If there is no way to assign any probabilities to future random events, we are addressing pure uncertainty.

• Even though this distinction is theoretically important, many writers omit it as a matter of convenience.
• There are many **types of risk** that business face such as:
  1. Changes in demand and supply conditions
  2. Technological changes and the effect of competition
  3. Changes in interest rates and inflation rate
  4. Exchange rates for companies engaged in international trade
  5. Political risk for companies with foreign operations
Steps for Managerial Decision Making:

1. Defining the goals of the organization
2. Identifying problems and opportunities
3. Analyzing alternatives from which choices can be made (Choosing alternatives always have costs and benefits)
4. Making choices that are best from the standpoint of the firm or organization (Optimal choice)
6. Implementation and monitoring the remedial actions.
The Economics of a Business

• The economics of a business refers to the key factors that affect the ability of a firm to earn an acceptable rate of return on its owners’ investment.

• The most important of these factors (microeconomic conditions) are
  1. **Competition**: how the market environment influences their ability to set prices and responds to competitors
  2. **technology**: how production technology and input prices affect costs
3. **Customers**: how consumer behavior affects revenue

- The economics of a business will be understood through the study of "four-stage model" of change
- The "four-stage model" shows how managerial economics is concerned on whether or not a potential market is penetrable and profitable to the firm.
- The "four-stage model" is a framework of change that shows how changing economic conditions affect well-established firms.
Stage I: Cost Plus

• “The good old days”.
• This refers to the ability of a well-established firm to dominate the market and control the price (kind of monopoly).
• It marks up its costs to achieve high profit margins (cost-plus pricing).
• However, changes in technology, competition and customers put downward pressure on a company's profit margins and market share and force firms into stage II.
Stage II: Crisis and Cost Management

• The company seeks refuge in cost management through cost cutting, downsizing, restructuring, and reengineering in response to these changes.
• But continual focus on cost had its limits in the ability of increasing profits.
• Markets are highly competitive in this stage.
• The firm is most likely to contemplate the nature of its production methods and cost behavior and assess the current level of competition which lead the firm to go to stage III.
Stage III: Reform and Revenue Management

• Because of the limits to the growth in profits, company tries to shift its focus from cost management to revenue management.

• Firms in stage III focus on narrowing product lines to those offering the greatest revenue potential.

• The focus is on "top-line growth" (which means the increase in gross sales or revenues).
• Although the company may have reaffirmed its ability to grow its top line, there is a question about its ability to grow in a profitable manner.

• Thus, stage IV becomes a necessary part of a company's full recovery from the impact of changing economics.
Stage IV: Recovery and Revenue Plus

• Company strives for **profitable growth** (revenue-plus).

• The firm in this stage will continue to increase its revenue but with more focus on **profit**.

• It is a necessary part of the company's full recovery from changing economics.
APPENDIX 1
Review of Economic Terms

• Microeconomics Vs. Macroeconomics
• Scarcity and Opportunity Cost
  – Economic Goods Vs. Free Goods
  – marginal or incremental approach
  – optimization
  – Allocation decision
• Resources (Factors of Production)
• Society: What, How, and For Whom
• Firm: What, How, and For Whom
• Allocation decisions must be made because of scarcity. Three choices:
• What should be produced?
• How should it be produced?
• For whom should be produced?
• Economic decisions of the firm

*What* - begin or stop providing goods/services (production)

*How* - hiring, staffing, capital budgeting (resourcing)

*For whom* – target the customers most likely to purchase (marketing)
• Although firms mainly are market oriented we can apply the command and traditional process to them.

• There are essentially five ways a country can answer these questions:
  1. Market Mechanism
  2. Command Mechanism
  3. Mixed Mechanism
  4. Islamic Mechanism
  5. Traditional Mechanism
Economic Models

Entrepreneurs versus Managers
